

Amendments to the Specification:

In the Detailed Description of the Preferred Embodiment:

Please amend the first paragraph on page 4, describing Figure 2, as follows:

Figure 2 is a block diagram illustrating the apparatus 40 interconnected to the telephone unit 43[[42]]. The apparatus 40 includes interconnection logic 42 which allows switching between the port 44 connected to the notebook computer, port 46 connected to the telephone wire, and wire 48 connected to the telephone unit 43[[42]]. The interconnection logic 42 routes the analog voice signals between ports 44 and 46~~and 48~~, routes the signals from the notebook computer to the network~~notebook~~ card 50; and routes the Ethernet signals from the network card 50 out the port 46 to the telephone wire. Due to the passive filtering as discussed above, much of the connections in the interconnection logic can be simple connections. The network card 50 is preferably an Ethernet card such as the type which support 10 base T Ethernet connections. The ports 44 and 46 include~~includes~~ port regions defined within the shell 52 of the apparatus.

Please update all records accordingly.
